AI/ML Project: Disease Prediction System using Machine Learning

Project Title: Disease Prediction System using Machine Learning

Project Details:

Domain: Artificial Intelligence and Machine Learning
Project Name: Disease Prediction System
Level: Intermediate

Project Description:

The "Disease Prediction System using Machine Learning" project aims to develop an intelligent system that predicts the likelihood of a person having a particular disease based on various health-related features. The system will utilize machine learning algorithms to analyze historical health data and make predictions, contributing to early disease detection and proactive healthcare management.

Project Objectives:

1. Data Collection:
   - Gather a diverse dataset containing relevant health features, including but not limited to age, gender, BMI, blood pressure, cholesterol levels, and family medical history.

2. Data Preprocessing:
   - Perform thorough data cleaning and preprocessing to handle missing values, outliers, and ensure data quality.
   - Normalize or standardize features to bring them to a consistent scale.

3. Feature Selection:
   - Employ feature selection techniques to identify the most influential variables for disease prediction.
   - Ensure that selected features contribute significantly to the accuracy of the machine learning models.

4. Model Development:
- Explore and implement various machine learning algorithms such as logistic regression, decision trees, random forests, and support vector machines for disease prediction.
- Evaluate and compare the performance of different models using metrics like accuracy, precision, recall, and F1-score.

5. Cross-Validation:
- Implement cross-validation techniques to assess the generalization performance of the models and mitigate overfitting.

6. Hyperparameter Tuning:
- Fine-tune the hyperparameters of selected machine learning models to optimize their performance.

7. Model Interpretability: (optional)
- Enhance the interpretability of the models to provide insights into the factors influencing the predictions.
- Use techniques such as SHAP (SHapley Additive exPlanations) values or feature importance plots.

8. User Interface:(optional)
- Develop a user-friendly interface that allows users to input their health-related data and receive predictions about the likelihood of having a particular disease.

9. Integration with Electronic Health Records (EHR): (optional)
- Explore the integration of the disease prediction system with electronic health records, facilitating seamless information flow between healthcare providers and the system.

10. Documentation:(optional)
- Provide comprehensive documentation covering data sources, methodology, model architecture, and instructions for using the prediction system.

11. Validation and Testing:
- Conduct extensive testing and validation to ensure the accuracy, reliability, and robustness of the disease prediction system.

Submission Instructions:

1. Follow all the instructions mentioned in the attached Instruction PDF.
2. Zip the entire project file, including all necessary documents, assets, and source code.
3. Submit the zipped file through Google Classroom.
4. Include the GitHub repository link (if applicable) and the live website link in the submission form.

Important Dates:

- Last Date for Submission: February 05, 2024

We encourage you to approach this project with creativity and professionalism. Success in this project will further enhance your internship profile. Ensure timely project submission.
